Summary
The objective of this course is to present the main models, formalisms and algorithms necessary for the development of applications in the field of natural language information processing. The concepts introduced during the lectures will be applied during practical sessions.

Content
Several models and algorithms for automated textual data processing will be described: (1) morpho-lexical level: electronic lexica, spelling checkers, ...; (2) syntactic level: regular, context-free, stochastic grammars, parsing algorithms, ...; (3) semantic level: models and formalisms for the representation of meaning, ...

Several application domains will be presented: Linguistic engineering, Information Retrieval, Text mining (automated knowledge extraction), Textual Data Analysis (automated document classification, visualization of textual data).

Keywords
Natural Language Processing; Computationnal Linguistics; Part-of-Speech tagging; Parsing

Learning Outcomes
By the end of the course, the student must be able to:
• Compose key NLP elements to develop higher level processing chains
• Assess / Evaluate NLP based systems
• Choose appropriate solutions for solving typical NLP subproblems (tokenizing, tagging, parsing)
• Describe the typical problems and processing layers in NLP
• Analyze NLP problems to decompose them in adequate independant components

Teaching methods
Ex cathedra; practical work on computer

Expected student activities
attend lectures and practical sessions, answer quizzes.

Assessment methods
4 quiz during semester 25%, final exam 75%

Resources
Virtual desktop infrastructure (VDI)
No
