The goal of this course is to instruct the student how fundamental scientific knowledge can be applied for drug discovery and development. We will demonstrate these principles with examples, including obesity, diabetes, and atherosclerosis.

Content

General principles of drug development [target-based versus whole cell-based screens, target identification, target validation, screening, hit to lead optimization, rational drug design, process research, efficacy, toxicity / safety, preclinical & clinical development, ...

- Use of animal models and human genetics in drug discovery
- The business environment [markets, patients/consumers, competitors]
- Project management [sponsors, stake-holders and their expectations, checkpoints, milestones, execution]
- Commercialization [business plan, regulatory, product launch, Intellectual property]
- Pathophysiology and therapeutic strategies for disorders of energy balance and mitochondrial function [fasting-feeding cycles, nutrition, hormonal control of energy homeostasis, obesity, diagnosis, pathogenesis, prevention and treatments]
- Pathophysiology and therapeutic strategies for cardio-metabolic diseases [type-2 diabetes, atherosclerotic heart disease, lipid homeostasis, chronic inflammation, diagnosis, pathogenesis, prevention and treatment]
- Case studies

Keywords
Drug discovery
Drug development
Drug targets
Screening
ADME/T
Drug-drug interactions Pharmacology

Learning Prerequisites

Required courses
Bachelor in Life Sciences, Physical Sciences, Pharmacology or equivalent
Important concepts to start the course

History of chemotherapy and the design of randomised clinical trials. Nature of drug targets and the mechanisms of action of some commonly used drugs and antibiotics. Hit-finding, hit-to-lead and lead optimisation towards a candidate drug.

Learning Outcomes

By the end of the course, the student must be able to:

• Explain concept of combination therapy
• Assess / Evaluate the effect of comorbidities
• Estimate pharmacological properties using in vitro ADME/T
• Explore possible drug-drug interactions
• Propose new combination therapies to treat comorbidities
• Discuss current drugs and their effects
• Estimate the economic impact
• Report potential societal value

Transversal skills

• Use a work methodology appropriate to the task.
• Access and evaluate appropriate sources of information.
• Communicate effectively with professionals from other disciplines.
• Give feedback (critique) in an appropriate fashion.
• Manage priorities.
• Make an oral presentation.
• Write a literature review which assesses the state of the art.
• Plan and carry out activities in a way which makes optimal use of available time and other resources.

Teaching methods

After ex-cathedra introduction sessions, detailing the pathophysiology of some common metabolic diseases, the teaching proceeds with weekly sessions of office hours and group work in close collaboration with the teacher. Scientific publications will be analyzed by individual students and presented to the group.

Expected student activities

Database searches
Literature reviews
Analysis of scientific articles
Presentation of salient points
Discussion of findings in a more general context

Assessment methods

• Continual assessment during the semester.
• Written Project.
• Oral defense of the project and questions on course work.

Resources
Bibliography

Ressources en bibliothèque

- Molecules and Medicines / Corey
- Goodman & Gilman's: The pharmacological basis of therapeutics / Brunton
- Harrison's Principles of Internal Medicine / Kasper
- A pharmacology primer, theory, applications and methods / Kenakin

Prerequisite for

Masters
