Remarque
Integrated and holistic systems approach from molecules to health - For MSc students only

Summary
We will introduce the fundamentals of nutrition and its impact on human health and disease. Then we will introduce a concept and strategy termed "Integrated systems approach", i.e., a multidisciplinary methodology to better define human health based on holistic phenotyping of human individuals.

Content
- Fundamentals of nutrition and its impact on human health and disease
- Discussion of traditional and novel experimental designs for evaluating the role of nutrition in human health
- Introduction and current utility/challenges of omics technologies for nutritional and health sciences, with emphasis on the characteristics of the technologies (genomics, proteomics, metabolomics, lipidomics, micronutrient analysis)
- Translations and applications of molecular phenotyping in the areas of human ageing and metabolic/gastrointestinal health.
- Molecular signaling pathways and regulation of nutrient uptake and utilization
- Concept and utility of molecular phenotyping and integrated systems analysis.

Learning Outcomes
By the end of the course, the student must be able to:
- Define the basics of nutrition and its impact on human health
- Demonstrate knowledge about current omics technologies and their utility and limitations for human nutrition and health research
- Develop a molecular and systems understanding of the role of nutrition in health
- Define key molecular and cellular pathways that control glucose and energy homeostasis

Transversal skills
- Access and evaluate appropriate sources of information.
- Summarize an article or a technical report.
- Demonstrate the capacity for critical thinking

Teaching methods
Lectures and exercises

Expected student activities
Reading, analysis and presentation of articles.

Assessment methods
Written exam during the semester
