Summary
This course gives an introduction to the fundamental concepts and methods of the Digital Humanities, both from a theoretical and applied point of view. The course introduces the Digital Humanities circle of processing and interpretation, from data acquisition to new understandings.

Content
This course gives an introduction to the fundamental concepts and methods of the Digital Humanities, both from a theoretical and applied point of view. The course introduces the Digital Humanities circle of processing and interpretation, from data acquisition to new understandings. The first part of the course presents the technical pipelines for digitising, analysing and modelling written documents (printed and handwritten), maps, photographs and 3D objects and environments. The second part of the course details the principles of the most important algorithms for document processing (layout analysis, deep learning methods), knowledge modelling (semantic web, ontologies, graph databases) generative models and simulation (rule-based inference, deep learning based generation). The third part of the course focuses on platform management from the points of view of data, users and bots. Students will practise the skills they learn directly analysing and interpreting Cultural Datasets from ongoing large-scale research projects (Venice Time Machine, Swiss newspaper archives).

Week 1
Introduction to the course and Digital Humanities, structure of the course

Week 2
Introduction to the DH circle of processing and interpretation (acquisition, processing, analysis, visualisation, UX, interpretation). From data acquisition to new understandings.

Part I : Pipelines
Week 3

Week 4

Week 5
Pipeline for Artworks photographs. Segmentation. Features detection. Detail search.

Week 6

Part II : Algorithms
Week 7

Week 8

Week 9
Algorithms for Generative models and simulation : Rule-based inference, Deep learning based generation

Part III : Platform management
Week 10

Week 11
User Management : Representation, Rights, Traceability, Vandalism, Motivation, Negotiation spaces

Week 12
Bot Management : Versioning, Open source repositories.

Learning Prerequisites
- Required courses
  - Basic math
  - One programming course

Learning Outcomes
By the end of the course, the student must be able to:
  - Explain the great transformations of Human and Social sciences
  - Synthesize the contents of several articles
  - Compare different types of research
  - Identify the main trends of the domain

Transversal skills
  - Take account of the social and human dimensions of the engineering profession.
  - Summarize an article or a technical report.
  - Demonstrate the capacity for critical thinking

Teaching methods
- Lectures, exercises
