Basic and advanced NMR - Level 1 A (EPFL)
Bornet Aurélien, Emsley Lyndon, Stevanato Gabriele

Cursus Chimie et génie chimique
Sem. Obl.

Language English
Credits 2
Session Oral
Exam
Workload 60h
Hours 40
Lecture 17
Practical work 23
Number of positions 12

Frequency Every year

Remarque
Next time: January 2020 (Block)

Summary
Basic theoretical and experimental aspects of NMR will be taught. Students will be familiarized with modern NMR spectrometers.

Content
Basic theoretical and experimental aspects of NMR will be taught. Students will be familiarized with modern NMR spectrometers (shimming, locking, tuning, pulse length determination etc). Furthermore they will learn basic NMR experiments: 1H and 13C NMR, different decoupling schemes, relaxation measurements, spin echo techniques, coherence transfer experiments (INEPT), etc. NMR of quadrupolar nuclei and of nuclei with low sensitivity will be treated. The primary intention is to teach PhD students and post-docs so that they can benefit from the NMR spectrometers available at EPFL, and to give them a sound foundation in NMR for various applications in organic and inorganic chemistry. PhD students and post-docs who have followed the course successfully should be able to perform standard NMR experiments independently. They should also be able to help colleagues in various research groups who wish to use NMR. Passing the theoretical and practical exams will give 2 credits to PhD students.

Note
Block course organized annually
The course "Basic and Advanced NMR - Part 1" will comprise a theoretical part with mainly ex-cathedra teaching, and practical exercises on research NMR spectrometers. Participation in the practical work will be limited to 12 participants. Four groups of three participants will be accompanied by an assistant and practice on all 4 spectrometers in turn.

Learning Prerequisites
Recommended courses
Résonance magnétique nucléaire(3rd year course by G. Bodenhausen) or equivalent
