Summary

This course presents the physical principles and the recent research developments on three topics of particle and nuclear physics: the physics of neutrinos, dark matter, and plasmas of quark and gluons. An emphasis is given on experimental aspects in these three fields.

Content

Neutrino physics:

- Absolute neutrino mass, beta and double beta desintegration experiments. Mass generation mechanism, Majorana and Dirac particles.
- Neutrino oscillations, MNS matrix.
- Cosmic neutrinos : origin, energy spectrum and detection.

Dark matter:

- Evidence for dark matter from astronomical and cosmological data.
- Relic particles of the "Big bang". Candidates for dark matter, and link with particle physics beyond the Standard Model.
- Direct and indirect searches for dark matter.

Quark gluon plasma (QGP):

- Plasma of quark and gluons: properties, plasma signatures, production in the collisions of heavy ions. Implications in cosmology.

Learning Prerequisites**Recommended courses**

Nuclear and particle physics I and II, Quantum mechanics I and II, Elementary particle physics I, Physics of atoms, nuclei and elementary particles

Learning Outcomes

By the end of the course, the student must be able to:

- Interpret fundamental results in neutrino, dark matter, and quark and gluon plasma physics
- Identify the physical observables in these three fields of research

- Judge the experimental methods and results presented in scientific publications
- Discuss the experimental principles in these fields
- Assess / Evaluate the experimental sensitivity of experiments

Teaching methods

Ex cathedra and exercises in the classroom

Assessment methods

oral exam (100%)

Supervision

Office hours	No
Assistants	Yes
Forum	No
