| <b>Number of positions</b> |                 |

**Summary**

This course provides insight into a broad variety of High Performance Computing (HPC) concepts and the majority of modern HPC architectures. Moreover, the student will learn to have a feeling about what architectures are suited for several types of algorithms.

**Content**

HPC overview:

- Today's HPC: Beowulf-style clusters, massively parallel architectures, hybrid computing, accelerators
- HPC history and background
- HPC benchmarks explained
- Multicore systems
- Scaling

Writing HPC code:

- Shared memory parallelism with OpenMP
- Distributed memory parallelism with MPI
- Hybrid programming with OpenMP and MPI
- GPGPU primer
- Profiling

**Keywords**

HPC, Parallelization, MPI, GPU

**Learning Prerequisites****Required courses**

- Analysis, bachelor level
- Numerical analysis for engineers
- Matrix algebra
- Programming concepts in scientific computing

**Learning Outcomes**

By the end of the course, the student must be able to:

- Classify the types of HPC architecture
- Identify codes suited for parallelizing
- Apply the most common parallelization techniques
- Implement algorithms in parallel
- Investigate the performances of parallel code
- Argue about the differences in performances between theory and practice
- Optimize the usage of hardware and software resources depending on the type of algorithm to parallelize

**Transversal skills**

- Set objectives and design an action plan to reach those objectives.
- Communicate effectively with professionals from other disciplines.
- Access and evaluate appropriate sources of information.
- Write a scientific or technical report.

**Teaching methods**

Lectures, exercises, project work

**Expected student activities**

Attendance at lectures, completing exercises, writing a project

**Assessment methods**

Oral defense of project work

**Supervision**

|              |     |
