## Summary

The aim of this course is to provide an introduction to the theory of a few remarkable phenomena of condensed matter physics ranging from the Quantum Hall effects to superconductivity.

## Content

#### Magnetism of insulators

- Review of band theory
- Mott insulators and Hubbard model
- Heisenberg model
- Spin-wave theory of ferromagnets and antiferromagnets

## Orbital magnetism of metals and semiconductors

- Landau levels
- De Haas-Van Alphen and Shubnikov-de Haas oscillations
- 2D electron gas: Integer and fractional Quantum Hall effects

## Theory of superconductivity

- Electron-phonon interaction
- BCS theory
- Landau-Ginsburg theory
- Flux quantization and Josephson effect

## **Learning Prerequisites**

## **Recommended courses**

Good grasp of quantum mechanics and solid state physics say at the level of "Lectures on quantum mechanics" by Gordon Baym and "Solid state physics" by Ashcroft and Mermin

# Learning Outcomes

By the end of the course, the student must be able to:

• Explore the quantum properties of solids

## **Transversal skills**

positions

- Access and evaluate appropriate sources of information.
- Continue to work through difficulties or initial failure to find optimal solutions.

Teaching methods

Ex cathedra. Exercises in class

Assessment methods

Written exam.

Resources Bibliography Lecture notes

Prerequisite for Solid state physics IV
