

MATH-617

Quantum groups and crystal bases

Gerber Thomas

Cursus	Sem.	Type
Mathematics		Obl.

Language of teaching	English
Credits	1
Session	
Exam	Oral presentation
Workload	30h
Hours	28
Courses	14
TP	14
Number of positions	

Frequency

Only this year

Remark

From 8 April 2019 to 31 May 2019

Summary

Quantum groups are deformations of universal enveloping algebras of certain Lie algebras. In this course, we study representation theory of these quantum groups and introduce Kashiwara's theory of crystal bases.

Content

- Kac-Moody algebras and associated quantum groups
- integrable representations
- crystal bases and crystal graphs
- example of $\mathfrak{sl}(2, \mathbb{C})$

Note

The students will be required to independently work out examples and fill in details left as exercises.

Keywords

representation theory, combinatorics, Lie algebras, quantum groups, crystals

Learning Prerequisites**Required courses**

Representation theory

Learning Outcomes

By the end of the course, the student must be able to:

- state the fundamental results linking crystal combinatorics and representation theory, and to compute examples of crystals.
