**Internet analytics**

Grossglauser Matthias

<b>Cursus</b>	<b>Sem.</b>	<b>Type</b>
Communication systems minor	E	Opt.
Communication systems	BA6	Opt.
Computer science	BA6	Opt.

Language of teaching	English
Credits	5
Session	Summer
Semester	Spring
Exam	Written
Workload	150h
Weeks	14
<b>Hours</b>	<b>5 weekly</b>
Courses	2 weekly
Exercises	1 weekly
Project	2 weekly
<b>Number of positions</b>	

**Summary**

Internet analytics is the collection, modeling, and analysis of user data in large-scale online services, such as social networking, e-commerce, search, and advertisement. This class explores a number of the key functions of such online services that have become ubiquitous over the past decade.

**Content**

The class seeks a balance between foundational but relatively basic material in algorithms, statistics, graph theory and related fields, with real-world applications inspired by the current practice of internet and cloud services.

Specifically, we look at social & information networks, recommender systems, clustering and community detection, search/retrieval/topic models, dimensionality reduction, stream computing, and online ad auctions. Together, these provide a good coverage of the main uses for data mining and analytics applications in social networking, e-commerce, social media, etc.

The course is combination of theoretical materials and weekly laboratory sessions, where we explore several large-scale datasets from the real world. For this, you will work with a dedicated infrastructure based on Hadoop & Apache Spark.

**Keywords**

data mining; machine learning; social networking; map-reduce; hadoop; recommender systems; clustering; community detection; topic models; information retrieval; stream computing; ad auctions

**Learning Prerequisites****Required courses**

Stochastic models in communication (COM-300)

**Recommended courses**

Basic linear algebra  
Algorithms & data structures

**Important concepts to start the course**

Graphs; linear algebra; Markov chains; Java

**Learning Outcomes**

By the end of the course, the student must be able to:

- Explore real-world data from online services
- Develop frameworks and models for typical data mining problems in online services
- Analyze the efficiency and effectiveness of these models
- data-mining and machine learning techniques to concrete real-world problems

### Teaching methods

Ex cathedra + homeworks + lab sessions

### Expected student activities

Lectures with associated homeworks explore the basic models and fundamental concepts. The labs are designed to explore very practical questions based on a number of large-scale real-world datasets we have curated for the class. The labs draw on knowledge acquired in the lectures, but are hands-on and self-contained.

### Assessment methods

Labos 35%, examen final 65%
