Summary

This course is on the foundations of digital communication. The focus is on the transmission problem (rather than being on source coding).

Content

Optimal receiver for vector channels Optimal receiver for waveform (AWGN) channels Various signaling schemes and their performance Efficient signaling via finite-state machines Efficient decoding via Viterbi algorithm Communicating over bandlimited AWGN channels Nyquist Criterion Communicating over passband AWGN channels

Keywords

Detection, estimation, hypothesis testing, Nyquist, bandwidth, error probability, coding, decoding, baseband, passband, AM, QAM, PSK.

Learning Prerequisites

Required courses Signal processing for communications and Modèles stochastiques pour les communications

Important concepts to start the course Linear algebra, probability.

Learning Outcomes

By the end of the course, the student must be able to:

- Estimate the error probability of a communication link
- Design a "physical layer" communication link
- Implement a prototype of a "physical layer" transmitter/receiver via Matlab

Teaching methods

Ex cathedra + exercises + project. Lots of reading at home and exercises in class.

With continuous control
