Summary

Machine learning methods are becoming increasingly central in many sciences and applications. In this course, fundamental principles and methods of machine learning will be introduced, analyzed and practically implemented.

Content

1. Basic regression and classification concepts and methods: Linear models, overfitting, linear regression, Ridge regression, logistic regression, k-NN, SVMs and kernel methods
2. Fundamental concepts: cost-functions and optimization, cross-validation and bias-variance trade-off, curse of dimensionality.
3. Neural Networks: Representation power, backpropagation, activation functions, CNN, regularization, data augmentation, dropout
5. Dimensionality reduction: PCA and matrix factorization, word embeddings
6. Advanced methods: Adversarial learning, Generative adversarial networks

Keywords
Learning Prerequisites

Required courses
- Analysis I, II, III
- Linear Algebra
- Probability and Statistics (MATH-232)
- Algorithms (CS-250)

Recommended courses
- Introduction to machine learning (CS-233)
- ...or similar bachelor lecture from other sections

Important concepts to start the course
- Basic probability and statistics (conditional and joint distribution, independence, Bayes rule, random variables, expectation, mean, median, mode, central limit theorem)
- Basic linear algebra (matrix/vector multiplications, systems of linear equations, SVD)
- Multivariate calculus (derivative w.r.t. vector and matrix variables)
- Basic Programming Skills (labs will use Python)

Learning Outcomes
By the end of the course, the student must be able to:
- Define the following basic machine learning problems: Regression, classification, clustering, dimensionality reduction, time-series
- Explain the main differences between them
- Implement algorithms for these machine learning models
- Optimize the main trade-offs such as overfitting, and computational cost vs accuracy
- Implement machine learning methods to real-world problems, and rigorously evaluate their performance using cross-validation. Experience common pitfalls and how to overcome them
- Explain and understand the fundamental theory presented for ML methods
- Conduct a real-world interdisciplinary machine learning project, in collaboration with application domain experts
- Define the following basic machine learning models: Regression, classification, clustering, dimensionality reduction, neural networks, time-series analysis

Teaching methods
- Lectures
- Lab sessions
- Course Projects

Expected student activities
Students are expected to:

- attend lectures
- attend lab sessions and work on the weekly theory and coding exercises
- work on projects using the code developed during labs, in small groups

Assessment methods

- Written final exam
- Continuous control (Course projects)
