Summary

In this lecture, we will describe the theoretical models and computational methods for the analysis of wave propagation along transmission lines.

Content**1. Transmission Line Theory**

Hypotheses, overview of models, Transmission Line and Antenna Mode Responses, derivation of telegrapher's equations

2. Transient analysis for lumped source excitation

Transmission of a pulse on an ideal line, multiple reflections, Bergeron diagram, reflections for different types of loads

3. Wave propagation on multiconductor systems

Determination of line inductance parameters, determination of line capacitance parameters, incorporation of losses. Modal analysis.

4. Transient analysis for distributed source excitation : field-to-transmission line coupling

Derivation of generalized Telegrapher's equations for field-excited lines. Representation of source terms. Different formulations of field-to-transmission line coupling equations. Plane wave excitation.

Learning Prerequisites**Recommended courses**

Electromagnetics I, II

Learning Outcomes

By the end of the course, the student must be able to:

- Analyze transmission lines in the frequency domain
- Analyze transmission lines in the time domain
- Be able to match a multiconductor transmission lines
- Analyze transmission lines excited by external electromagnetic fields
- Compute/measure parameters of a transmission line

Teaching methods

Ex cathedra and integrated exercises

Assessment methods

Continuous control

Resources

Bibliography

Analysis of multiconductor transmission lines, C.R. Paul, Wiley, 1994.

Interaction of electromagnetic fields generated by lightning with overhead electrical networks, C.A. Nucci, F. Rachidi, in "The Lightning Flash", IEE Press, 2003.
