

ME-104

**Introduction to structural mechanics**

Kim Sangwoo, Vacat .

<b>Cursus</b>	<b>Sem.</b>	<b>Type</b>
Mechanical engineering	BA2	Obl.

Language of teaching	English
Coefficient	6
Session	Summer
Semester	Spring
Exam	Written
Workload	180h
Weeks	14
<b>Hours</b>	<b>6 weekly</b>
Courses	4 weekly
Exercises	2 weekly
<b>Number of positions</b>	

**Summary**

The student will acquire the basis for the analysis of static structures and deformation of simple structural elements. The focus is given to problem-solving skills in the context of engineering design.

**Content**

The course presents the fundamental basis for the analysis of static structures. The course material is presented with an emphasis on abstraction, formulation, and solution of simplified mathematical models, which make it possible to design and analyze real structures and mechanisms, rationally. Concrete engineering examples and demonstrations are provided throughout the course. Through a combination of lectures, example problems, practical demonstrations and hands-on activities, the student will be introduced to structural analysis and learn how to calculate internal loads and the deformation of simple structural systems. The course also serves as an introduction to the more advanced engineering mechanics curriculum that EPFL students will be exposed to later in their degree, including structural mechanics, continuum mechanics, and solid mechanics.

The course may cover, but not exclusively, the following topics:

- System of forces;
- Equilibrium of a rigid body;
- Simple structures (trusses, frames, and machines);
- Distributed loads;
- Energy methods to analyze structures;
- Deformation of simple structural elements;
- Mechanical instabilities: Buckling.

**Keywords**

Statics, Equilibrium, Mechanism, Structure

**Learning Prerequisites****Required courses**

There are no pre-requisites for this course.

**Recommended courses**

PHYS-101 General Physics: Mechanics (Physique générale: mécanique).

**Important concepts to start the course**

Familiarity with vector calculus, linear algebra and ordinary differential equations.

### Learning Outcomes

By the end of the course, the student must be able to:

- Model and analytically solve simple problems of statics and stress analysis, S1
- Analyze and design assemblies of simple mechanical elements in the framework of static and buckling S2

### Transversal skills

- Use a work methodology appropriate to the task.
- Plan and carry out activities in a way which makes optimal use of available time and other resources.
- Continue to work through difficulties or initial failure to find optimal solutions.
- Assess one's own level of skill acquisition, and plan their on-going learning goals.

### Teaching methods

Lectures, example problems, homework, practical demonstrations and hands-on activities.

### Assessment methods

Final written exam (100% of the final grade)

### Supervision

Office hours	No
Assistants	Yes
Forum	Yes
Others	The teachers are happy to answer students' questions, in person, during the break, or after lectures, or during office hours (by appointment).

### Resources

#### Virtual desktop infrastructure (VDI)

No

#### Bibliography
