

MICRO-706

Microfluidics for lab-on-a-chip

de Malsche Wim, Le Gac Séverine

Cursus	Sem.	Type
Computational and Quantitative Biology		Opt.
Microsystems and Microelectronics		Opt.

Language of teaching	English
Credits	1
Session	
Exam	Term paper
Workload	30h
Hours	14
Lecture	14
Number of positions	30

Frequency

Every 2 years

Remark

Next time: Spring 2026

Summary

The course covers the entire field of lab-on-a-chip technology, including microfluidic principles and various microfabrication approaches, and presenting concrete examples of devices for (bio)analysis, cell biology, tissue regeneration and microreactors.

Content

- Introduction to microfluidics and lab-on-a-chip technology – origins - scaling laws – applications
- Microfluidic principles: flow actuation; pumps; mixers; valves; etc.
- Introduction to fabrication techniques for the production of microfluidic devices, using “cleanroom materials” such as silicon and glass, as well as polymer materials.
- Surface modification: surface passivation; and immobilization of active and/or recognition elements
- (Bio)molecule analysis: sample preparation; molecular separation; integrated devices for biomolecule analysis
- Microreactors
- Microfluidics for cell biology: engineering device for experimentation on cells; tissue regeneration and organ-on-a-chip platforms

Keywords

Microfluidics, Lab-on-a-Chip, Bioanalysis, Microfabrication, Organ-on-a-Chip
